ABSTRACT

A system for delivering confidential test results to anonymous subjects. The system includes procuring a unique personal identifier or personal identification number (PIN) from a first source, which communicates that PIN to a second source that is capable of taking and/or testing a suitable test specimen from the patient being tested. The second source receives a biological sample identified by the PIN from the patient or a patient representative and performs a test on the biological sample to detect genetic and/or medical information and provides a test result. The test result is then provided to the patient through an internet site, phone system or in person, and accessed by the patient through the unique PIN.
